Title : The study of renal pelvis-kidney Refluxes

Periodical : Vest. Rent. i Rad. 38-49, Mar/Apr 1954

Abstract : Studied refluxes [backward flow] between the renal pelvis and the kidney. Found that there are two basic types: fornical and tubular. These can be detected by pyelography.

Institution : Faculty Surgical Clinic (Director - Professor A. Ya. Pytel') Stalingrad Medical Institute

Submitted : Presented at the joint meeting of the Stalingrad Surgical and Urological Society, April 17, 1953.

2772. HEPATO-RENAL SYNDROME IN UROLOGY (Russian text) - Pytel A. Ya. -
UROL. 1957, 5 (26-33)

The clinical picture of hepato-renal failure following urological operations and that following surgery of the liver, biliary tract or other organs are identical. Acute renal failure as seen in the hepato-renal syndrome manifests itself clinically as oliguria, anuria, hyperazotaemia and uraemia. Hepatic and renal ischaemia and anoxia produced by reflex humoral mechanism is the main factor in the pathogenesis of hepato-renal disturbance leading to autolysis of the liver lobules. Duration of ischaemia has a prognostic significance and predetermines the degree of renal injury. The functional inadequacy of the barrier mechanism of the liver produces favourable conditions for development of nephrolithiasis. The latter, in turn, may lead to hepatopathy with various degrees of liver failure. Investigation of the hepatic function before any major urological operation is essential. Latent hepatopathy, as can be shown by functional tests, influences the development, course and outcome of some diseases of the renal tract.
